Immunopharmacology, as its name suggests, is the branch of pharmacology that applies to the immune system. In general immunopharmacology describes the manipulation of the immune system and immune responses by pharmacological modulators, for the benefit of the host. This is an immense, and continually expanding field.

Immunopharmacology | Pharmacology Education Project
Medical definition of immunopharmacology: a branch of pharmacology concerned with the application of immunological techniques and theory to the study of the effects of drugs especially on the immune system.

- An immune system is a system of biological structures and processes within an organism that protects against disease by identifying and killing pathogens and tumor cells.
- Detects a wide variety of agents, from viruses to parasitic worms.
- Needs to distinguish them from the organisms own healthy cells and tissues.
