This book makes Moore's wisdom available to students in a lively, richly illustrated account of the history and workings of life. Employing rhetoric strategies including case histories, hypotheses and deductions, and chronological narrative, it provides both a cultural history of biology and an introduction to the procedures and values of science.

In *AI Art*, Joanna Zyliniska cuts through the smoke and mirrors surrounding the current narratives of computation, robotics and Artificial Intelligence. Offering a critique of the political underpinnings of AI and its dominant aesthetics, this book raises broader questions about the conditions of art making, creativity and labour today.

Animal evolution has always been at the core of Biology, but even today many fundamental questions remain open. The field of animal 'evo-devo' is leveraging recent technical and conceptual advances in

development, paleontology, genomics and transcriptomics to propose radically different answers to traditional evolutionary controversies. This book is divided into four parts, each of which approaches animal evolution from a different perspective. The first part (chapters 2 and 3) investigates how new sources of evidence have changed conventional views of animal origins, while the second (chapters 4-8) addresses the connection between embryogenesis and evolution, and the genesis of cellular, tissue and morphological diversity. The third part (chapters 9 and

10) investigates how big data in molecular biology is transforming our understanding of the mechanisms governing morphological change in animals. In closing, the fourth part (chapters 11-13) explores new theoretical and conceptual approaches to animal evolution. 'Old questions and young approaches to animal evolution' offers a comprehensive and updated view of animal evolutionary biology that will serve both as a first step into this fascinating field for students and university educators, and as a review of complementary approaches

German critic Walter Benjamin wrote some immensely influential words on the work of art in the age of mechanical reproduction. Luxury fashion houses would say something shorter and sharper and much more legally binding on the rip-off merchants who fake their products. Marcus Boon, a Canadian English professor with an accessible turn of phrase, takes us on an erudite voyage through the theme in a serious but engaging encounter with the ideas of thinkers as varied as Plato, Hegel, Orson Welles, Benjamin, Heidegger,

A Primer on Reptiles and Amphibians is an innovative educational resource designed to forge a connection between the reader and the creeping critters of the world. Turtles, frogs, lizards, salamanders, snakes, and crocodiles; these animals evoke fear and fascination.

This primer dispels myths and unlocks mysteries surrounding these diverse survivors which have mastered virtually every habitat on Earth.

Tragically, these animals now face pressures of unprecedented severity, but there is still time to make a difference if more of us work together. Micha Petty is an international award-winning Master Naturalist and wildlife rehabilitator. This critically-acclaimed debut volume is a collection of Micha's interpretive writings, carefully crafted to make learning easy for everyone. These bulletins display his passion for

Hawaii is known throughout the world for its uniquely hospitable climate and people. Because of its geographical isolation and tropical-subtropical location, it harbors numerous animals that are

unknown elsewhere in the United States.

Unfortunately, Hawaii is special in another respect: it is the endangered species capital of the world. Many of its birds are in jeopardy of extinction. This book, the first to portray a tropical seabird community, treats the 22 species of seabirds of the Hawaiian archipelago from a conservationist point of view. Craig S. Harrison first establishes the setting, describing Hawaii's birth from undersea volcanoes, its marine biology, and the effects of Polynesians and Westerners on its pristine island

ecosystem. He summarizes current knowledge of albatrosses, shearwaters, petrels, frigatebirds, boobies, tropicbirds, terns, and noddies, explaining their similarities and differences with respect to nesting, food habits, migration at sea, and adaptation to a tropical environment.

Written for non-experts, this volume introduces the mechanisms that underlie reticulate evolution. Chapters are either accompanied with glossaries that explain new terminology or timelines that position pioneering scholars and

their major discoveries in their historical contexts. The contributing authors outline the history and original context of discovery of symbiosis, symbiogenesis, lateral gene transfer, hybridization or divergence with gene flow and infectious heredity. By applying key insights from the areas of molecular (phylo)genetics, microbiology, virology, ecology, systematics, immunology, epidemiology and computational science, they demonstrate how reticulate evolution impacts successful survival, fitness and speciation. Reticulate evolution brings forth a

challenge to the standard Neo-Darwinian framework, which defines life as the outcome of bifurcation and ramification patterns brought forth by the vertical mechanism of natural selection.

Reticulate evolution puts forward a pattern in the tree of life that is characterized by horizontal mergings and lineage crossings induced by symbiosis, symbiogenesis, lateral gene transfer, hybridization or divergence with gene flow and infective heredity, making the "tree of life" look more like a "web of life." On an epistemological level, the

The case studies presented examine topics including the origin of the eukaryotic cell and its organelles through symbiogenesis; the origin of algae through primary and secondary symbiosis and dinoflagellates through tertiary symbiosis; the superorganism and holobiont as units of evolution; how endosymbiosis induces speciation in multicellular
